

# ACCUMASTER PRO digital

## geophysical locator – voids and gold detector

Accumaster Pro Digital is a geophysical locator - gold detector that is also designed for the reliable location of ground voids, popular places for hiding gold treasures (cave, tunnel, bunker, tomb etc). Accumaster Pro Digital will locate only large masses of gold, metals, mineral ore and subsurface water. Accumaster Pro Digital locator has been proven in archaeology, geology, mining, gold & treasure hunting applications.

The advantages of a geophysical locator like Accumaster Pro Digital compared to the usual metal detectors is the total rejection against small objects buried near the ground surface. Metal trash fragments, gun shells, aluminum foil do not interfere while hunting for the large, deep buried gold targets, such as a treasure chest.

The usage of Accumaster Pro Digital geophysical locator is simple therefore does not require an experienced user. The geophysical gold detector panel is built in a waterproof carry case, that includes an external 12 volt / 7,2 Ah battery

For the location, the supplied 4 ground rods are hammered into the soil, in a square format covering the suspected area, up to 706 sq. meters. Each ground rod connects through a wire to the geophysical locator panel, where every probe pair has a numbered test switch. Total 6 switches for the 4 sides and the 2 diagonal probe pairs of the square. By pressing its correspondent test switch, one by one, probe pairs transmit a high electrical voltage known as "carrier wave" into the ground.

The Accumaster Pro Digital geophysical locator instantly measures and displays on an LED meter, the total electrical resistivity value received from the area between those probes. The underground resistivity changes with factors like voids, metals or water. The target meter features illuminated scales in OHM resistivity values with categories for gold, silver, copper, iron, minerals, water deposits and ground voids.

### ACCUMASTER PRO Digital OHM display

**Hold a test switch for 2 seconds and determine target location within a 706 sq. meter scan area / 20 m. depth, and up to 3421 sq. meters / 33 m. depth with extension wire.**

**By popular demand our ACCUMASTER-PRO now in digital version!**

**With a new 2 scale bar graph indicates accurately voids, water, minerals, iron, gold & precious metals.**

**The digital readings are bright enough to view in low light conditions, even in the night.**

**What's more is that with ACCUMASTER-PRO digital, there are no adjustments for the user to worry about, no complex operation, nothing to tune.**

**The ACCUMASTER-PRO digital geophysical locator is all automatic.**

**Simply power on and start scanning the underground. Digital accuracy and simplicity in electronic geophysics for everybody to use. Press the test switches and start the location / detection of treasures up to 33 meters depth.**

## SPECIFICATIONS

- 100 Watt SIGNAL POWER INTERNAL ELECTRONIC INVERTER
- SCAN AREA 706 TO 3421 SQ. METERS (WITH EXTENSION WIRE)
- DEPTH WITH EXTENSION WIRE SPOOLS 33 METERS
- DEPTH WITH STANDARD WIRE SPOOLS 20 METERS
- DIGITAL 2 SCALE LED OHM METER FOR TARGET ID
- BRIGHT LIGHT LAMP INDICATES GOLD & PRECIOUS METALS
- MAXIMUM DEPTH 33M ON LARGE VOIDS - TOMBS
- 4 GROUND RODS WITH 4 x 15 m. WIRE SPOOLS
- ACCESSORY 33 m. EXTENSION WIRE SPOOLS
- 12 v 7.2 Ah BATTERY AND 220 v BATTERY CHARGER

## FEATURES

- IGNORES SMALL / NEAR THE SURFACE OBJECTS
- PROFESSIONAL EQUIPMENT FOR PROFESSIONAL RESULTS
- 2 TEST TARGET DUMMY LOADS FOR IRON AND GOLD
- EASY TO USE SMALL AND PORTABLE
- ACCURATE & SCIENTIFIC GEOPHYSICAL LOCATOR
- COMES IN WATERTIGHT HEAVY DUTY CASE
- AUTOMATIC SCIENTIFIC TARGET ID - NO DOWSING
- 2 YEAR GUARANTEE & INSTRUCTIO S MANUAL

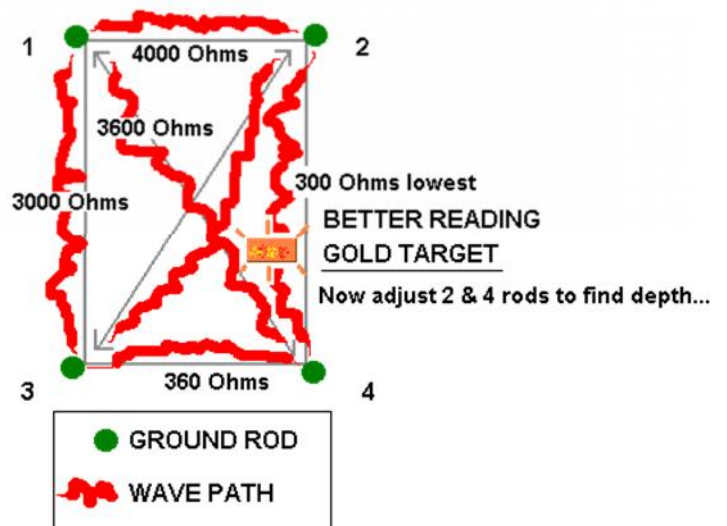

Find the gold location using the digital readings. When the 4 rods are positioned just like on the examples below, gold and silver targets indicate low OHM values at the Accumaster-Pro digital display, with the bar graph pointing to the "PRECIOUS METALS" mark. In order to find the treasure depth, follow the method shown at example 4.

**Example 1.:**

**A low (360 ohm) indication for a copper target**

**Example 2.:**

**300 ohm representing gold target**

**← LOWEST READING**  
 Notice extreme low reading at only one branch. It possibly means a good target outside the format. Shift forward to that side.

When a target has been located in the center of the format. You'll have an "X" reading (lowest resistivity which is the most desirable).

When a good conductive target is located near the bottom of format, 4 branches will show readings of + / - 300 or below.

**Example 3.:**

Find the lowest reading and move towards towards there, until the treasure is located

**DETERMINING DEPTH**

**Example 4.:**

When gold has been located, get target depth using this pattern
